

MATH 430 Fall 2020

Midterm 1

QILIN YE

Due by Sep 14th 2020 11:59 PM PST on Gradescope

Instructions: Midterm 1 is open notes and open textbook but closed to internet searches. Calculators are allowed though not needed. You are required to do the exam by yourself and not take the help of any person. Make sure you write down proper steps and reasons, mention any theorem/result you use in your solutions etc. Correct solutions but with unjustified/poorly reasoned claims will not receive full credit.

Answer all questions (5 × 10 points)

- Let a, b, N, K all be integers > 1 . Given that $\gcd(a^N, b^K) = 1$, find $\gcd(a, b)$. Explain your answer with reasons.
- Show that 8007 is NOT a sum of three squares. Explain your answer with reasons (Hint: Think mod 8)
- Solve for x where $16x + 10 \cong 46 \pmod{37}$. Show neat steps
- Find three consecutive integers, the first of which is divisible by a square, the second by a cube and the third by a fourth power. Show neat steps.
- For some integer, $n > 1$, you are given that $2^{10} \cong 1 \pmod{n}$ and $3^5 \cong 1 \pmod{n}$. Find a value i where $0 \leq i \leq n - 1$ so that

$$6(2^{2019} + 3^{2019}) \cong i \pmod{n}.$$

Explain your answer with reasons.

1) Suppose $\gcd(a, b) = n > 1$, then we have $n|a$ and $n|b$. Therefore

$$n|a \Rightarrow n|a^N \text{ and } n|b \Rightarrow n|b^K.$$

Hence $n > 1$ is a common divisor of a^N and b^K . Contrary to $\gcd(a^N, b^K) = 1$.

Therefore $\gcd(a, b) = 1$.

2) Computing the remainders of squares when divided by 8 by brute force:

$$\pmod{8} \mathbb{Z} / 8\mathbb{Z}.$$

$$[0]^2 = [0] = [0]$$

$$[1]^2 = [1] = [1]$$

$$[2]^2 = [4] = [4]$$

$$[3]^2 = [9] = [1]$$

$$[4]^2 = [16] = [0]$$

$$[5]^2 = [25] = [1]$$

$$[6]^2 = [36] = [4]$$

$$[7]^2 = [49] = [1].$$

$$\text{and } [8007] = [8000 + 7] = [7].$$

Since it's impossible to get $[7]$ (or $[3]$) as a sum of three elements in the set $\{[0], [1], [4]\}$ (with replacement so that each can be picked multiple times), we conclude that 8007 can't be written as the sum of 3 squares.

$$3. \quad 16x + 10 \cong 46 \pmod{37} \Leftrightarrow 16x \cong 36 \equiv -1 \pmod{37}.$$

Then, for some $y \in \mathbb{Z}$ we have

$$\begin{aligned} 16x + 37y &= -1 \\ \Rightarrow 16(-y) + 37(-y) &= -1. \end{aligned}$$

Since $\gcd(16, 37) = 1$, there will be solutions. Now apply Euclid's Algorithm.

$$37 = 16 \times 2 + 5 \Rightarrow 5 = 16 \times (-2) + 37 \times 1$$

$$16 = 5 \times 3 + 1 \Rightarrow 1 = 16 \times (-3) + 5 \times (-3)$$

$$= 16 \times (-16 \times 6 + 37 \times (-3))$$

$$= 16 \times (-97) + 37 \times (-3)$$

$$\text{Hence } 16 \times (-7) + 37 \times (-3) = 1 \Rightarrow 16x(-7) = 37y(-3) - 1.$$

$$\Rightarrow 16 \times (-7) \equiv -1 \pmod{37}$$

$$\Rightarrow 16 \times (-7) + 10 \equiv 9 \pmod{37}$$

$$\Rightarrow \text{Set of solutions} = \{-7 + 37k, k \in \mathbb{Z}\} \\ = \{30 + 37k, k \in \mathbb{Z}\}$$

5. From $2^{10} \cong 3^5 \equiv 1 \pmod{n}$ we know $n|1023$ and $n|242$.

Since $1023 = 3 \times 11 \times 31$, $242 = 2 \times 11^2$, if $n > 1$ then the only possibility is $n=11$.

In $\mathbb{Z}/11\mathbb{Z}$, we have

$$[6(2^{2019} + 3^{2019})]$$

$$= [6(2^{2019+9} + 3^{2019+9})]$$

$$= [6 \cdot 2^{2028} + 6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

$$= [6 \cdot 2^{2028}] + [6 \cdot 3^{2028}]$$

4. For simplicity let's make the divisors as small as possible:

$$4^{\text{th power}} \rightarrow 2^8 = 16, \text{ cube: } 3^3 = 27, \text{ square: } 5^2 = 25$$

Suppose the largest number among the three is n , then

$$\begin{cases} 25 \mid n-2 & \textcircled{1} \\ 27 \mid n-1 & \textcircled{2} \\ 16 \mid n & \textcircled{3} \end{cases} \Rightarrow \begin{cases} n \equiv 2 \pmod{25} & \textcircled{1} \\ n \equiv 1 \pmod{27} & \textcircled{2} \\ n \equiv 0 \pmod{16} & \textcircled{3} \end{cases}$$

By the Chinese Remainder Theorem,

$$\text{we first find } x \text{ such that } \begin{cases} x \equiv 2 \pmod{25} \\ x \equiv 1 \pmod{27} \end{cases}.$$

Note in $\mathbb{Z}/27\mathbb{Z}$, $[2] \cdot [16] = [49] = [22]$.

Since $[22] \cdot [7] = [49] = [22]$, we know $[7] \cdot [49] = [2] = [22] \cdot [7]$.

Hence let $x = (-10) \cdot 27 + 16 = -698$.

Now find b such that $\begin{cases} b \equiv 1 \pmod{25} \\ b \equiv 16 \pmod{27} \end{cases}$.

$$\text{In } \mathbb{Z}/27\mathbb{Z}, [25] \cdot [16] = [400] = [19].$$

Note that $[-9] \cdot [19] = [-171] = [16]$, hence

$$\text{let } b = 16 \cdot 25 \cdot 16 = 6400.$$

Finally, find c such that $\begin{cases} c \equiv 0 \pmod{16} \\ c \equiv 27 \pmod{25} \end{cases}$.

Obviously we can let $c = 16 \cdot 25 \cdot 7 + 400 \cdot 2 = 16800$.

Then $a+b+c = 11122$ is the number we want.

Furthermore, $11122 = 16 \times (25 \cdot 27 \cdot 16) + 352$ also works.

Verification: $\begin{cases} 352 = 25 \cdot 14 \\ 352 = 27 \cdot 13 \\ 352 = 16 \cdot 22. \end{cases}$

Hence one solution is $\{350, 327, 352\}$.
